

F11 — Context bound ordering: $H_{\text{factored}} \geq H_{\text{joint}} \geq H(m|\text{goal}) \geq H(G)$
 Each level of receiver context gives a strictly tighter rate bound

(A) Bound ordering holds for all 5 seeds
 $H_{\text{factored}} \geq H_{\text{joint}} \geq H(m|\text{goal}) \geq H(G)$ [OK=True]

(B) Gap attribution: what each context level saves
 (TC = joint coding gain, free post-hoc)
